Concerning the Cedar Valley Water Rights in the Iron County Water Management Plan, could consideration be given the 1950s and 1960s water rights to allow owners to use the depletion calculations under the voluntary program, where one quarter down to ten percent of those water rights could be saved if they were metered or measured and used at a 10% to 25% of volume of water, with intensive water saving devices such as one gallon per hour emitters per 2000 plants per acre?

This would provide great incentive to use smaller amounts of water rights to the highest efficiency modern technology can provide.

Sincerely,

Gaylen and Amanda Matheson
